MULTIRAIL® Dynamic Solutions

As markets become more efficient and goods commoditized, profits are won and lost in logistics. Schenck's new solution combines weigh beams and interconnected sensors to weigh product, minimize wear, and perform safety checks without stopping freight. And with axel-by-axel weighing, extended straight-stretches are no longer necessary.

The Multirail is NTEP Certified at 14 mph, can weigh loads in sections, and assesses wheel condition at up to 155 mph.

Installed without foundations or gaps, the Multirail can weigh solids or liquids dynamically and accurately without jarring the load. This also ensures there's no unnecessary wear and no further speed limitations imposed on the track.

In addition to screening for wheel defects, the Multirail alerts operators of over-capacity and uneven loads. This helps protect the life of equipment, minimize risk of derailment, and ensure greater comfort with less noise.

Multirail not only saves money by saving time, but it minimizes wear and helps reduce liability.

Whether you'd like to assess Multirail's fit for your application or have technical questions, don't hesitate to give us a call or drop by the office. There's always an answer.

A-1 Scales Come With A-1 Service

With over 30 years experience and thousands of installs under our belt, we confidently and efficiently deliver any static or dynamic heavy-industrial application. Our technicians are not only the most knowledgeable in the business, but they're thorough, responsive, and never leave a site undone. Whether it's a truck pit, rail-scale, or onboard system, we stand behind every client and every install every time.
